SPECIMEN REQUIREMENTS

PATIENT IDENTIFICATION:
• Verify patient name and date of birth prior to specimen collection.
• Specimens must be labeled in the presence of the patient.

LABELING:
• Patient name (last & first)
• Date of Birth (DOB)
• Initials of phlebotomists—must be legible
• Date and Time of collection

ORDER OF DRAW GUIDELINES (CLSI):
NOTE: THE GOAL IS TO PREVENT CROSS CONTAMINATION OF TUBE ADDITIVES.
NEVER TRANSFER BLOOD FROM ONE COLLECTION TUBE TO ANOTHER COLLECTION TUBE.

• Blood Culture
• Coagulation tubes (blue top)
• Serum tubes (with or without clot activator)
• Heparin (green top tubes, with or without plasma separator)
• EDTA (lavender top tubes)
• Glycolytic inhibitor tubes (gray top tubes)

NOTES:
• Submit a sufficient number of tubes for all tests ordered.
• Check expiration dates on all collection devices. **DO NOT USE IF EXPIRED.**
• **REFER TO SERVICE DIRECTORY** on how to store specimens regarding refrigerated, room temp, & frozen samples.
REQUISITIONS

Submit all information:

- Name *
- DOB*
- SSN
- Address & Phone
- Insurance Info
- Providers Signature (NO STAMPS)*
- Printed Providers name
- Clinical Diagnosis or ICD10 code*
- Date ordered*
- CLEARLY mark or write specific tests requested
  Make sure to specify (QUAL, QUANT, Ab, Ag, Differential or w/ REFLEX) for the appropriate tests

* REQUIRED General Requisition information
Blood Specimen Collection
Adult Venipuncture
Greet the Patient

• Begin by letting the patient know who you are.
• Inform the patient that you will be drawing his or her blood.
• Ask the patient to tell you her or his name and date of birth.
• Identify the patient using a minimum of 2 unique identifiers.

Note: This is a Joint Commission Requirement

Assemble Supplies

• See Service Directory for testing requirements
  – Choose the appropriate tubes for the tests ordered.
  – Example: Protime → Light Blue Sodium Citrate Tube
Position Patient

- Position patient in bed or chair
- Keep the arm outstretched and supported

Infection Control

1. Wash your hands
2. Put on protective gloves

Note: Gloves must stay intact for the duration of the procedure
Tourniquet

• Apply tourniquet 3-4 inches above venipuncture site

• Tourniquet should remain in place no longer than 1-2 minutes

Select Site

• Have the patient make a fist (avoid pumping)

• Search for venipuncture site

Avoid

• Keep in mind where nerves are found.

• Avoid these areas
  – Healed Burns, Extensive Scaring, or Hematoma.
  – Drawing from an arm on the same side as a mastectomy without physician approval.
  – Drawing from an arm having a Cannula, Fistula, or Vascular access device.
Perform Phlebotomy

1. Thread Eclipse Needle into disposable adaptor.

2. Prep the site by rubbing it with an alcohol prep pad working in concentric circles from the inside out. Allow the site to air dry.

3. Holding the needle assembly in your dominant hand, remove the protective sheath from the needle. Hold the assembly with the bevel facing up.

4. Stabilize the vein (with your non-dominant hand), using the thumb to draw the skin taut distal to the puncture site.

5. Insert the needle, bevel up, at no more than a 30 degree angle.

6. Engage collection tube(s) following guidelines with respect to order of draw.
   - Blood Culture Bottles
   - Coagulaton Tubes (blue top)
   - Serum Tubes (with or without clot activator)
   - Heparin Tubes (green top, with or without plasma separator)
   - EDTA Tubes (lavender top)
   - Glycolytic Inhibitor Tube (gray top)

7. Remove tourniquet within 1 minute.

8. After the last tube has been disengaged, remove the needle from the vein, and immediately apply pressure to the site.

9. Engage the safety device of the eclipse needle, and discard the whole needle assembly.
Post Venipuncture

• While patient applies pressure to wound, mix specimens by gentle inversion.  
  *Note: Unmixed specimens will produce inaccurate test results.*

• Label all specimens in the presence of the patient
  *Note: Must be labeled with patient’s full name, DOB, time, date, & Initials of person who collected the specimen*

• Apply bandage to wound
  *Note: Instruct patient to leave bandage on for at least 15 minutes.*

Inspect Area

• Dispose of supplies

• Inspect patient area to be sure all venipuncture supplies have been removed
  *Note: Supplies such as caps can be choking hazards.*

• Wash Hands
Instructions for Winged Collection Set

• Peel back package at arrow
• Remove from package
• Insert end into hub/Screw into place
• Using technique described above perform the following
  o Place Tourniquet
  o Select Site
  o Prep Site
• Remove cap
• Choose handling technique

- Once the needle is inserted in the vein, a flash will appear.
- Fill specimen tubes according to correct order of draw.
- Activate push button while in-vein.
- Follow Post Venipuncture instructions stated previously.
Blood Specimen Collection
Pediatric
SKIN PUNCTURE BLOOD COLLECTION

Choose puncture site:

**Adult and child > 1 yr old**

- palmar surface of the middle or ring finger’s distal phalanx

**Neonates and infants**

- lateral or medial plantar surface of heel

If necessary, warm site using Medichoice heel warmer
SKIN PUNCTURE BLOOD COLLECTION

- Cleanse site w/70% isopropyl alcohol, allow to dry
- Puncture heel/finger across the print grain
- Wipe away first drop of blood
- Hold puncture site downward applying intermittent pressure to surrounding tissue; avoid repetitive “milking”
- Fill micro tube via capillary action

Order of Draw:
(Different than venipuncture)
- EDTA
- Other additive TUBES
- Specimen requiring serum
  *EDTA & anticoagulated samples should be capped & gently inverted immediately*
HEMOLYSIS

**Definition:** breakage of red blood cells causing the release of internal components into the surrounding fluid.

*Avoid submitting HEMOLYZED specimens for testing. Results will be inaccurate if tested on hemolyzed specimens.*

**Cause**
- Prolonged tourniquet time
- Failure to allow complete drying of alcohol at prep site
- Slow draw
- Too small or too large needle
- Pulling back too forcefully on syringe plunger
- Vigorous mixing or shaking of specimens
- Exposure to excessive heat or cold

**Effect**
- Slight hemolysis has little effect on most test values
- Common test results **increased** by hemolysis: $K^+$, $LD$, $AST$, $ALT$, $CK$, $Iron$, $Phosphorus$, $Total\ Protein$, $Albumin$, $Mg^+$, $Calcium$ and $ALP$
- Common test results **decreased** by hemolysis: $T4$, $Haptoglobin$, $Troponin\ T$
HEMOLYSIS INDEX

[Image of test tubes with different levels of hemolysis indicated by color and numerical values.]
SERUM SEPARATOR TUBES

- SST tubes provide serum for testing analysis:
  - Chemistry
  - Special Chemistry
  - Serology / Immunology
- Refer to service directory for specific testing requirements
- Follow specific testing recommendations in regards to handling (room temp/ refrigerated/frozen)
- Allow specimen to clot **completely** before centrifuging specimen. To spin BD gel vacutainer tubes:
  - Non-gel- spin 10 minutes ≤ to 1300 RCF per minute
  - Gel tubes- spin at 1000-1300 RCF/Min for 10 minutes with swinging buckets and 15 for fixed buckets.
  - Gel tubes must be spun within 2hrs
- Serum or plasma should be separated from the cells as soon as possible. Maximum time limit is two hours from the time of collection.
- Specimen should be free of particulate matter.
Lithium Heparin Tube

• *Always mix by gentle inversion after collection.*
• Used for routine chemistry tests.
• Certain exceptions apply. Examples of tests that cannot be drawn in lithium heparin tubes include:
  – Therapeutic Drug Levels
  – Hepatitis testing
  – Cancer antigens
  – RF, RPR and infectious mono tests
• Refer to specimen directory for specific requirements.
Lavender Tube (EDTA)

*Always mix by gentle inversion after collection.*

<table>
<thead>
<tr>
<th>Test</th>
<th>Requirements</th>
</tr>
</thead>
</table>
| CBC      | • Must be run within 24 hours of collection.  
           • Store at room temperature.  
           • Minimum- one ml of blood required.  
           • **NOTE: A differential (manual or auto) is **NOT **performed unless it is specified on the requisition.** |
| ESR      | • Stable for 12 hours if refrigerated.  
           • Tube must be at least half full. |
| Hg A1C   | • Stable for 7 days if refrigerated. |
| BNP      | • Stable at room temperature for 24 hours. |
| iPTH     | • Spin and separate ASAP- stable for 8 hours at room temperature. |

**SPECIMENS WILL BE REJECTED IF THE SPECIMEN IS:**

• Clotted,  
• Not properly stored,  
• Not properly labeled with the patient’s full name and DOB,  
• Too old.
LIGHT BLUE TUBES (CITRATE)

• *Always mix by gentle inversion after collection.*
• A discard tube **MUST** be used if specimen is to be drawn using a winged blood collection set. This is to remove air from the collection devise to ensure proper blood volume is obtained in the tube.
• Specimens **MUST** be filled to the line for adequate equilibration. **DO NOT** overfill.
• Label tube with patient name, DOB, date, time
• If aliquoting plasma into transfer tube, **DO NOT** disturb buffy coat.
• For special coagulation test refer to service directory for specific testing requirements.

Urine
URINE COLLECTION

URINALYSIS

• Label specimen with patient name, DOB, date and time.
• Screw cap tightly to prevent leaking.
• Specimen is kept refrigerated.
• Test must be run within 24 hrs of collection.
• Specify on requisition if the provider wants a “reflex to micro” or a urine microscopic along with the chemical analysis.

IF NOT SPECIFIED ON THE REQUISITION, ONLY A CHEMICAL URINALYSIS WILL BE PERFORMED.

A “clean catch” should be obtained if there is a possibility of adding a URINE CULTURE to the specimen.
URINE COLLECTION

URINE CULTURE

- Have patient wash with provided towlettes prior to giving a “clean catch” sample.
- Label specimen with patient name, DOB, date and time.
- Sample must be refrigerated and sent to the main lab ASAP (within 24 hrs of collection).
URINE COLLECTION

Random Urine

- Specific handling may be needed depending on the requested test; refer to specimen directory.
URINE COLLECTION

24 Hour Urine Collection

- Follow providers directions regarding food, drink or drugs during collection process.
- *Remember to record start time and date, patient name, DOB, and provider on the container!*
- Discard the FIRST morning sample (only one concentrated sample collected).
- Keep refrigerated and return to the lab ASAP.
MALE and FEMALE URINE
GC & CHLAMYDIA by PCR

- Patient should not urinate 1 hr prior to this collection.
- Collect the first 15-60 ml of voided urine (NOT A CLEAN CATCH).
- <15 or >60 ml maximum or specimen will be rejected. Excessive urine will cause a false negative result!
- Specimen is kept refrigerated.
- Label specimen with patient name, DOB, date and time.
Stool
STOOL SPECIMEN CONTAINERS

CARY-BLAIR TRANSPORT VIAL
(orange cap)

- Cultures for enteric pathogens:
  - Salmonella
  - Shigella
  - Campylobacter
- WBC’s
- Enterohemorrhagic E-Coli
- Yersinia

- Specimens kept at room temperature.
- Label with patient name, DOB, time and date.
STOOL SPECIMEN CONTAINERS

PVA & FORMALIN 2 VIAL SYSTEM

(pink & gray caps)

• Ova & Parasites
• Giardia Antigen
• Cryptosporidium

• Specimens kept at room temperature.
• Label with patient name, DOB, time and date.
STOOL SPECIMEN CONTAINERS

- Sterile cup (White Cap)
- Label with patient name, DOB, time and date.
- Return to Laboratory ASAP (within 24 hours of collection).

*Specimen must be liquid for C Diff.*
STOOL SPECIMEN CONTAINERS

HEMOCCULT CARDS

Fecal occult blood

- Follow directions on test cards.
- Verify cards are not expired!
- Cards kept at room temperature.
- Label with patient name, DOB, date and time.
- Return to lab ASAP (within 14 days of collection).
Blood Cultures
BLOOD CULTURE SUPPLIES - ADULT

Aerobic and Anaerobic Bac/T Alert
BLOOD CULTURE SUPPLIES - PEDIATRIC

Pediatric
Bac/T Alert
Greet the Patient

- Begin by letting the patient know who you are.
- Inform the patient that you will be drawing his or her blood.
- Identify the patient using a minimum of 2 identifiers.

*Note: This is a Joint Commission Requirement*

Prepare Supplies

- Remove metal stoppers
- Clean each rubber stopper with an alcohol prep pad
- Place a new alcohol prep pad on top of the bottle – do not remove until just prior to collection

Materials Needed

- Test requisition and/or labels
- Tourniquet, gloves, marking pen
- Disposable needle holder with Butterfly needle
- Chloraprep (Use alcohol prep pad for patients under 2 months of age)
- 2x2 inch dry gauze sponge
- Surgical adhesive tape or band-aid
- Blood Culture Bottle
- Approved biohazard sharps container
**Position Patient**

- Position patient in bed or chair
- Keep the arm outstretched and supported

**Infection Control**

- Wash your hands
- Put on protective gloves

*Note: Gloves must stay intact for the duration of the procedure*
Tourniquet

• Apply tourniquet 3-4 inches above venipuncture site
• Tourniquet should remain in place no longer than 1-2 minutes

Select Site

• Have the patient make a fist (avoid pumping)
• Search for venipuncture site

Avoid

• Keep in mind where nerves are found.
• Avoid these areas
  – Healed Burns, Extensive Scaring, or Hematoma.
  – Drawing from an arm on the same side as a mastectomy without physician approval.
  – Drawing from an arm having a Cannula, Fistula, or Vascular access device
Perform Phlebotomy

1. Thread Butterfly into disposable adaptor.
2. Prepare site for venipuncture using the following steps.

   **Age: Birth – 2 Months**

   *Note: Alcohol prep pads are used on this age group to push bacteria away from the venipuncture site. Using Chloraprep could cause irritation or chemical burns.*
   - Open alcohol prep pad, and place directly on the venipuncture site.
   - Move the alcohol prep pad in concentric circles away from the venipuncture site.
   - Allow area to dry for approximately 30 seconds. Do not blot or wipe away.

   **Age: Greater Than 2 Months**

   *Note: ChloraPrep is used on this age group to disinfect the venipuncture site. The maximum treatment area for one applicator is 2.5 inches by 2.5 inches.*
   - Tear ChloraPrep applicator pouch at side notch to reveal applicator handle. Do not touch foam applicator tip. Place foam flat side down on the venipuncture area.
   - Completely wet the venipuncture area.
   - Gently use repeated back and forth strokes of the applicator for approximately 30 seconds. Allow area to dry for approximately 30 seconds. Do not blot or wipe away.
   - Discard applicator after single use.
Perform Phlebotomy

3. Holding the needle assembly in your dominant hand, remove the protective sheath from the needle. Hold the assembly with the bevel facing up.

4. Stabilize the vein (with your non-dominant hand), using the thumb to draw the skin taut distal to the puncture site.

5. Insert the needle, bevel up, at no more than a 30 degree angle.

6. Using non-dominant hand, sequentially engage each BacT/Alert bottle into collection adaptor cap. See below for correct order of draw.

7. Collect blood culture bottles in the following order.
   - A. Aerobic Blood Culture Bottle / Pediatric Blood Culture Bottle
   - B. Anaerobic Blood Culture Bottle / Pediatric Blood Culture Bottle

   **Note:** The following are the optimal volumes. ***Do not overfill the bottle****
   - 10 mL from adult patients into each Aerobic / Anaerobic bottle.
   - 4 mL from pediatric patients into each Pediatric bottle.

8. Disengage last bottle. If additional blood is required for other testing, place the adaptor insert into the adaptor cap and snap into place. Sequentially insert vacuum collection tubes as required using the following order of draw.
   - A. Coagulation Tubes (blue top)
   - B. Serum Tubes (with or without clot activator)
   - C. Heparin Tubes (green top, with or without plasma separator)
   - D. EDTA Tubes (lavender top)
   - E. Glycolytic Inhibitor Tube (gray top)

9. Disengage the last tube from the adapter assembly.
Microbiology
Rapid Testing

MRSA Screen

MRSA screening by PCR is available for Pre admission (PAT) and inpatients only. Please contact microbiology for instructions and swabs. Use Cepheid Collection Device.

NOTE:

MRSA screen is used to detect carriers of MRSA in a health care setting for purposes of isolation. For all other requests, please submit e-swab for culture.
RAPID TESTING

Rapid Strep A

• Collect specimen with provided sterile swab from the tonsils and/or the back of the throat avoiding the teeth, gums, tongue or cheek surfaces and place in a tightly secured plastic transport container
• Do not use swabs with cotton tips, wooden shafts or calcium alginate swabs
• Do not use a collection system that contains charcoal or semisolid transport media
• Process swab as soon as possible after collection; if testing is delayed, the swabs can be stored up to 48 hrs at room temperature

Note:
✓ If requesting a Throat Culture or patient is less than 18 years old—submit a second swab or an e-swab.
RAPID TESTING

Rapid Trichomonas

• Collect specimens from the vaginal cavity with a provided sterile rayon swab and place in a clean transfer tube.
• Do not use cotton tip or wooden shaft swabs.
• Process the swab as soon as possible; if testing is delayed, specimens may be held at room temperature up to 24 hrs and up to 36 hrs refrigerated or frozen.

Note:
✓ If requesting a culture, submit an e-swab
Rapid Influenza and RSV by Direct Antigen Detection (NOT Performed by PCR Method)

- Collect nasopharyngeal specimens using the provided flocked swab with flexible shaft.
- Kits for rapid viral testing contain 1 ml of viral transport media.
- Place swab in vial containing the viral transport media.
- Refrigerate specimen and transport to laboratory ASAP.

Notes:
✓ For testing by PCR, refer to PCR collection instructions.
Rapid Influenza and RSV by PCR Method

- Testing by PCR is available for inpatient and ED patients only.
- Specimens must be collected using the Cepheid collection kit.
- Collect nasopharyngeal specimens using the provided flocked swab with flexible shaft.
- Kits for Cepheid PCR testing contain 3 mL of viral transport media.
- Place swab in vial containing the viral transport media.
- Refrigerate specimen and transport to laboratory ASAP.
VIRAL CULTURE COLLECTION

• Chlamydia Culture
• Pertussis
• Herpes
• Influenza Culture/DNA
• Mycoplasmas
• Ureaplasmas
• Misc. Viral Culture

Notes:
✓ Refrigerate specimen and transport to laboratory ASAP.
✓ General Viral Transport Media contains 3 ml of fluid. It may be used for rapid antigen testing if 2 ml of fluid is removed.
✓ Cap color may vary depending on manufacturer.
GC & CHLAMYDIA SWABS
PCR TESTING

Male - Urethra

Blue Probetec Swab
✓ Insert capped swab 2-3 cm into urethra and rotate swab
✓ Put swab back into tube and make sure cap is tightly secured
✓ Label specimen with patient name, DOB, date and time

Female - Urethra & Endocervical

Pink Probetec Swab
Remove cleaning swab from packing
✓ Using cleaning swab, remove excess mucous from the cervical outer surface
✓ Discard cleaning swab
✓ Remove collection swab from packaging
✓ Insert collection swab into cervical canal avoiding the vaginal mucosa
✓ Place swab back into tube and make sure cap is tightly secured
✓ Label specimen with patient name, DOB, date and time

Notes:

• Not to be used for detection of Oral or Eye GC/ Chlamydia (See information on GC & CHLAMYDIA Cultures).
• See “Urine Collection” section for instructions on collecting urine samples for PCR.
GC & CHLAMYDIA Cultures

• GC Culture-requires *Jembec CO2 collection system*. Contact microbiology to obtain the collection system.

• Viral transport media is required for chlamydia culture.
MICROBIOLOGY CULTURE SPECIMENS

e-SWABS (Regular) : Anaerobic & Aerobic

Preferred for aerobic and anaerobic culture types:

- Wound
- Genital Strep screen
- Throat
- Body Fluids
MICROBIOLOGY CULTURE SPECIMENS

E- Swabs (mini tip w/ flexible shaft)  
Anaerobic & Aerobic  
Preferred for Aerobic and Anaerobic culture types:  
  • Eyes  
  • Ears  
  • Nasal passages  
  • Throat  
  • Urogenital tracts  
  • Nasopharynx  
  • Pediatric Samples

DO NOT USE FOR TISSUE SPECIMENS
Tissue Cultures

Sterile cup with enough saline to prevent drying of the tissue

STERILE BODY FLUID CULTURES
Joint - Peritoneal - Pleural - Pericardial - Ascites

• Blood Culture Bottles
  Preferred
  (refer to Blood Culture Collection)
  Submit a sterile cup for Gram Stain
  OR

• Sterile Cup
  OR

• e-Swab
  Least preferred
  ✓ Use as a transport media
  ✓ Discard Swab
  ✓ Do not discard liquid
Blood Bank
BLOOD BANK

Lavender Tube (EDTA)

• Type and Screen

• Type and Crossmatch—see special instructions for requesting outpatient transfusions.

• Direct Coombs

✓ Label specimen with patient name, DOB, date, time, initials of collector.
BLOOD BANK

Instructions for Requesting Outpatient Transfusions

- Contact the hospital Admitting department to schedule outpatient transfusions.
- Patients are normally scheduled for transfusion two days after the specimen is collected for the type and crossmatch. This allows enough time to complete required testing.
- Performing the crossmatch on day of transfusion is discouraged:
  - Additional wait time for patient - 2 hours
  - Risk cancellation if patient has antibodies or product is not available
- Notify blood bank in advance for:
  - Plateletpheresis
  - Irradiated products
  - Patients with known antibodies
BLOOD BANK
Specimen Labeling for Transfusion Specimens

• Patients who will be receiving transfusions on an outpatient basis **MUST** receive an armband at the time of collection with 3 identifiers:
  ✓ Patients full name
  ✓ Date of Birth
  ✓ Hospital Medical Record number or TYPENEX unique identifier

• Patients who are drawn at Saratoga Hospital for their type and crossmatch will receive a hospital armband (preferred method).

• Patients drawn off-site must use the Typenex armband system. Contact the blood bank for additional information.

**NOTE:** **THE CROSSMATCH SPECIMEN MUST BE RECOLLECTED IF:**
• The armband is not applied at the time of collection.
• The specimen is not labeled with the required three identifiers
• The armband is removed prior to transfusion.
BLOOD BANK

**TYPENEX Armband**

- A Typenex armband is required for all outpatient transfusion patients whose specimens are not collected at Saratoga Hospital.
- The TYPENEX armband includes a unique identifier in an easy to read alphanumeric format.
- Computer generated labels are attached to the Typenex armband. This is preferred over a handwritten label.
- Labels must include the complete name, DOB, date/time and initials of the collector.
- Red “DO NOT REMOVE” tag serves as a reminder to patients not to remove the armband.
- Contact blood bank to obtained detailed instructions for use of the Typenex system.
Pathology
Submit **ALL REQUIRED** information on Outpatient CYTOLOGY/PATHOLOGY Requisitions:

- Patient’s full name
- Date of birth
- Address & phone number
- Insurance information
- Providers signature
- Providers name (print)
- Date of service
- Test
- Anatomic location and/or type of tissue
- Clinical Diagnosis or ICD-10 codes
- Copy to information (first & last name)
PATHOLOGY/HISTOLOGY
TISSUE SPECIMENS

Specimen Labeling
• Patient’s full name
• Date of birth
• Date of service
• Specimen source

Specimen Collection
Tissue biopsy
Placed in 10% formalin container
(supplied by laboratory upon request)

Bone Marrow
Core biopsy and aspirate – B-Plus Fixative
(supplied by laboratory upon request)
Additional aspirate:
(1) lavender tube (smear preparation)
(2) green top (flow cytometry and
cytogenetic testing)
CYTOLOGY NON-GYN SPECIMENS

Requisition
• Urine Cytology
  Voided or catheter must be checked
• Clinical Diagnosis and/or ICD-10 code is required

Specimen Labeling
• Patient’s full name
• Date of birth
• Date of service
• Specimen source

Specimen Collection
• Sputum
  50% alcohol or Cytolyt fixative
  (collection kits supplied by laboratory upon request)
• Urine
  50% alcohol or Cytolyt fixative
  (collection kits supplied by laboratory upon request)
• Body Fluids & Aspirations
  Collected in Cytolyt Fixative
• Spinal Fluid (CSF)
  NO FIXATIVE ADDED.
  Deliver Immediately to Cytology Lab
  (refrigerate if there is a delay in processing)
Requisition

• Choose Screening or Diagnostic Pap Smear
• Indicate specimen source (cervical, vaginal and/or endocervical)
• LMP (required)
• Clinical Diagnosis and/or ICD-10 codes required

Specimen Labeling
• Patient’s full name
• Date of birth
• Date of service

Specimen Collection

• Cytology GYN
Pap smears are collected by provider;
Placed in PreservCyt Solution (THINPREP vial)

• HPV
If ordered in addition to Pap Smear specify:
— HPV High Risk,
— HPV High Risk reflex 16/18,45
— HPV if ASCUS
Specimen Transport
Specimen Transport

*Prepping Specimens for Transport*:

- Process specimens according to their requirements.
- Ensure all aliquot tubes contain the description of their contents (plasma, serum).
- Store specimens until the time of transport according to their requirements.
- Place specimens in a biohazard specimen bag with the lab requisition in the outer sleeve.
- Label the outside of the biohazard specimen bag for all priority and stat specimens.
Specimen Transport

Transporting Specimens

• All Saratoga Hospital staff transporting laboratory specimens between facilities must participate in courier transport training.
• Laboratory specimens are packaged and transported according to the Code of Federal Regulations 49 CFR 171-173.
• Patient specimens from physicians’ offices are considered Category B.
• Combination packaging must be used, consisting of an inner and an outer packaging.
• A courier log must accompany the specimens containing the following.
  – Arrival time at customer.
  – What is dropped off.
  – What is picked up.
  – Number of specimen bags picked up.
• Laboratory staff will verify the number of bags dropped off.
The information included in the *Specimen Reference Guide* was obtained by current policies and procedures approved by Saratoga Hospital Laboratory. Review of laboratory policies and procedures are available on request.

Date of print: May 2016
